## 1 Objectives

1. Manipulate Common Font and Text Properties using CSS
2. External Fonts
3. the Box Model

## 2 Texts and Fonts

### Font Properties to Adjust

1. font-family:  
references only pre-installed fonts (more on this later)
2. font-size:  
can explicitly reference px height or use "em" for relative  
good idea: set base px height in body and em everywhere else
3. font-weight  
boldness of font, some fonts allow for numeric values besides just "bold"
4. line-height  
changes spacing of line (double space, etc.)
5. text-align  
left, right, center
6. text-decoration  
underline, strike through etc.

## 3 Google Fonts

find at [fonts.google.com](https://fonts.google.com)  
pick font and font-weight you want  
will be given a link to paste into the <head> tab of html  
make sure to use font family in CSS sheet then

## 4 Box Model

layout of the tags

**Box Model** Every element has a box around it
